

Snipify

Snipify is a live tutoring platform where learners book 30-minute sessions with skilled tutors and join real-time ZegoCloud video meetings — with a full **booking, availability, session-charging, credits, and wallet/payment** flow implemented end-to-end.

Deploy Link: <https://mysnipify.vercel.app/>

Before vs After — What Changed

This README shows the **base project** (what was given) and everything **newly implemented** from the assignment.

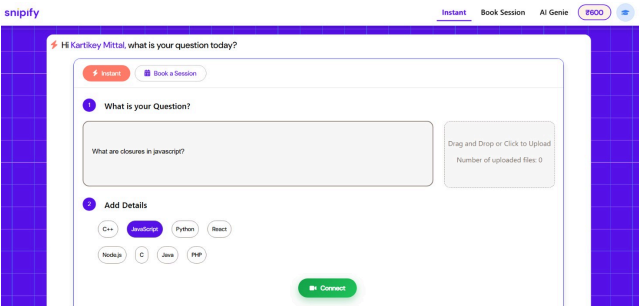

Area	Before (Base Project)	After (What I Implemented)
Tutor Booking	No booking concept — random tutor match-up only	Learners browse tutors by domain , view tutor availability , and book a 30-minute session
Tutor Availability	No availability system	Tutors set an availability timeframe (e.g. 7 AM – 11 PM) → the system auto-generates 30-minute slots inside that window
Slot Management	—	Tutors can see which slots are available / booked
Booking Management	—	Learner has My Bookings , tutor has Booked Sessions , double booking is prevented , all bookings stored in Firebase

Area	Before (Base Project)	After (What I Implemented)
Live Session	Separate/Zego rooms, no link to bookings	Booked sessions have a Start Now button → learner & tutor join the same ZegoCloud room using the same roomId
Session Charging	No billing	Every session gets 10 minutes free → after that ₹50 per 30-minute block ; duration & cost are recorded , credits deducted live during the session
Learner Credits	No credits	New learners get ₹500 starting credit ; current balance shown in navbar & live-room; balance can never go negative
Balance-Out Handling	—	When credits run out, learner gets a warning (Out of Credit) → after grace period the session ends automatically and learner is taken back to Home
Wallet / Payments	No payments	Phase 3: Wallet UI with current balance, top-up credits, payment/top-up history , powered by Dodo Payments (Test Mode)
Run-Out Flow	—	Credits out during session → Add Credits → Wallet → Dodo payment → credits instantly added to balance
Calendar Management	—	Tutors manage availability through a calendar UI (FullCalendar)

Implementation (Feature-by-Feature)

1 Tutor Booking

- Learners browse tutors filtered by **domain** (`FindTutor`).
- Each tutor card shows their **availability window**.
- Learners pick a free slot and **book a 30-minute session**.
- Booking is written to Firebase (`Bookings`) immediately.

2 Tutor Availability

- Tutors set a timeframe, for example **7 AM – 11 PM** (via `ManageAvailability` + `FullCalendar`).
- The system **generates 30-minute slots** inside that timeframe automatically.
- Slots show state: **available / booked** — booked slots are blocked from re-booking.

3 Booking Management

- **Learner side:** `MyBookings` — upcoming, ongoing, completed sessions.
- **Tutor side:** `BookedSessions` — see who booked what slot.
- **Double booking is prevented** (slot uniqueness check before write).
- All bookings, statuses, `sessionStartedAt` / `sessionEndedAt` are stored in **Firestore**.

4 Live Session (ZegoCloud)

- Every booked session gets a **Start Now** button.
- Learner (`room1`) and tutor (`RoomSkilled`) join the **same Zego room** via the same `roomId`.
- Live UI shows:
 - **LIVE** indicator + learner credit balance
 - **countdown timer bar** (free / paid / out-of-credit states)
- Leaving the room marks the booking **completed** and navigates back to Home.

5 Session Charging

- Auto-timer starts when the learner joins the room.
- **First 10 minutes are FREE** (`FREE_SECONDS = 10 * 60`).
- After that, every **30-minute block costs ₹50** (`BLOCK_COST = 50`).
- Blocks are charged **instantly** at block boundaries, credits deducted from the learner's balance.
- Charged blocks + duration recorded on the booking (`chargedBlocks`, `sessionStartedAt/EndedAt`).

6 Learner Credits

- New learners are created with **₹500 starting credit** (`creditBalance: 500` on signup).
- Current balance displayed in the **navbar** and inside the **live room**.
- **Balance can never go negative** — charging stops when balance < ₹50.

7 Balance-Out Handling

- When credits run out mid-session → **Out of Credit** warning modal with countdown (**5-minute grace period**).
- Learner gets two options: **Add Credits** (→ Wallet) or **End Session Now**.
- After the grace time, the session **ends automatically** and the learner is **redirected to Home**.
- The session can be resumed later from **My Bookings** after topping up.

8 Wallet / Payment — Phase 3 (Dodo Payments)

- **Dodo Payments Test Mode** integrated through a secure **Cloudflare Worker** (Dodo secret key never ships to the browser).
- **Wallet** ([learner/Wallet](#)) shows:
 - current credit balance
 - top-up options ([₹100](#) / [₹200](#) / [₹500](#) / [₹1000](#) → 1 credit = ₹1)
 - **payment / top-up history** with status
- Top-up flow: select amount → Dodo payment page → **polling** until payment succeeds → credits added to Firebase balance.
- **Run-out flow:** Out of Credit → [Add Credits](#) → Wallet → Dodo payment → credits added → resume session from My Bookings.
- **Test Card (Dodo):** [4576](#) [2389](#) [1277](#) [1450](#)

Tech Stack

Layer	Tech
Frontend	React 18 (CRA), React Router, FullCalendar, FontAwesome, Recharts
Backend	Express (server/), Node.js
Realtime Meetings	ZegoCloud (@zegocloud/zego-uikit-prebuilt)
Database	Firebase Firestore + Firebase Admin
Payments	Dodo Payments (Test Mode) via Cloudflare Worker (dodopayment.g6-kartikey.workers.dev)

Project Structure

```

src/
├── learner/      # Learner Home, FindTutor, TutorAvailability, MyBookings,
│                 # Wallet (Dodo top-up), LearnerSessions, LearnerStats
├── skilled/     # Skilled Home, ManageAvailability (calendar),
│                 # BookedSessions, Sessions, SessionCard, RoomSkilled
├── room/        # Live meeting rooms (room1, room2) + charging/countdown UI
├── login/       # Login / Signup (learner gets ₹500 credit)
├── utils/       # topup.js (Dodo worker helper), format, identity
├── components/  # Shared UI components
├── Firebase.js  # Firestore config
server/
├── server.js    # Express server
worker/         # Cloudflare Worker (Dodo Payments) – deployed separately

```

Installation

```
npm install  
npm start
```

Runs the app in development mode — open <http://localhost:3000>.

Environment / Keys needed

- **Firebase** config in `src/Firebase.js`
- **ZegoCloud** `appID` + `serverSecret` (in `src/room/room1.jsx`, `room2.jsx`, `src/skilled/RoomSkilled.jsx`)
- **Dodo Payments** worker deployed with Dodo keys (referenced in `src/utils/topup.js`)
